APPLICATIONS

Fresh Air Intake/Exhaust Outlet and Ventilation for Interior and Exterior Locations.

- Homes
- Warehouses
- Restaurants
- Condominiums
- Commercial Buildings
- Gymnasiums
- Apartments
- Retail Buildings

ALUMINUM VENT CAP SELECTION

1. To determine minimum free area required for vent, divide the required CFM flow by the maximum recommended free area velocity of 750 FPM. Given 125 CFM: Min. free area = $125 \text{ CFM} / 750 \text{ FPM} = 0.16 \text{ sq. ft.}$

2. From the Dimension table, find the corresponding minimum vent size. Model SXL 10 has 0.19 sq. ft. free area.

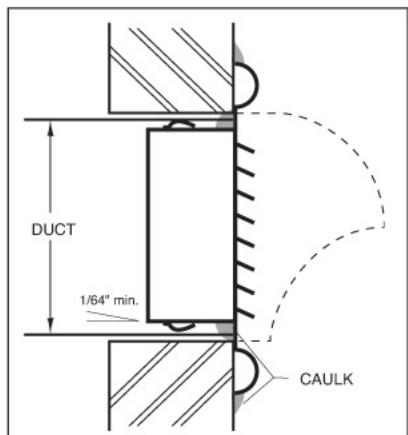

3. Verify the static pressure drop through the vent from the Pressure Drop Chart. Velocity of 750 FPM has 0.09 in. w.g. static pressure drop.

ALUMINUM VENT CAP INSTALLATION

■ SEIHO Vent Caps are designed and manufactured with the architect in mind for every venting need required...under roof vents where no duct attachments are required, or for specialty vents, as outlets, attached to internal ducts from fan systems.

■ SEIHO Vent Caps are designed for ease of installation on any exterior surface after all other mechanical and architectural work has been completed. There is no interference with other hidden or exposed items during the construction process, and therefore no cause for delays. Because of the lightweight aluminum construction SEIHO Aluminum Vent Caps are easily installed using only a high grade silicon Caulk. No special tools or techniques required. No adjustments are required.

*Note: No louver manufacturer warrants their louver to prevent water penetration under all possible circumstances of wind and rain.
