

VENTILATED FRIEZE BLOCKS

Superior Ventilation and Pest Control

Eaves are wonderful. A well-built eave is attractive, keeps rain from the walls, and provides a sheltered space in which to install attic ventilation. Unfortunately, like all vents, soffit and frieze block vents also provide a vector for pests to potentially enter the home.

In our experience, existing products have been unable to meet this menace. Wood or plastic construction easily rots or deforms over time, and is soft enough to be pecked or chewed away. What metal construction has been available is too flimsy to stand the test of time. Vent openings might be small enough to stymie birds and rodents, but too large to keep out equally annoying wasps and roaches. And simply doing away with venting is not an option—inadequate ventilation causes more problems than it solves.

Poor options cost professionals time and hassle, and homeowners money and headache. That's why HVACQuick is proud to offer its own line of superior ventilated frieze blocks. Ideal for open-eave construction and manufactured exclusively for us, these superior products let air into, and keep pests out of, the attic better than any available alternative.

Superior Design

All-aluminum construction makes our ventilated frieze blocks durable enough to withstand any amount of clawing, biting, or pecking. Manufactured in the USA, advanced techniques make individual holes small enough to keep out wasps and roaches, yet group them close enough together for superior net free ventilation area (Small 48.3 NFA per unit, large 85.8 NFA per unit). And since our aluminum does not rust or corrode our blocks will last: Once installed, they can outlive the house and still be reused or recycled.

Better for Homeowners

An ounce of prevention is worth a pound of cure. Poorly ventilated attics retain heat and moisture, burdening homeowners with unnecessary energy and maintenance costs, as well as making their home a less comfortable place to live. On the other hand, poorly designed vents allow birds, rodents, and insects free access, creating a health and safety concern that requires expensive remediation. Our ventilated frieze blocks provide superior ventilation *and* superior pest control, eliminating these concerns and saving the homeowner money.

Better for Builders

Adding ventilation to frieze blocks is time-consuming: sizing, cutting, drilling, and stapling. By arriving ready to install, our ventilated frieze blocks save that time and expense. Made in 2 standard sizes*, each piece is bracketed to fit seamlessly into a standard 22.5" x 3.5" or 22.5" x 5.5" rafter bay, and pre-drilled screw holes makes installation quick and easy. Moreover, fitting effective, weather-proof ventilation between the rafters eliminates the need for costly soffits, allowing for open eaves and saving room in the budget.
